

Tridion x Fluid Topics

The **Tridion-Fluid Topics connector** makes your favorite tools work as one to turn your content into a personalized and engaging user experience.

Publish your **Tridion-authored** content wherever you need with Fluid Topics' Content Delivery Platform.

Embrace Content-as-a-Service

- + Fluid Topics is an AI-powered Content Delivery Platform that captures technical documentation from all sources and transforms it into a smart knowledge hub. The relevant content is then delivered to any digital channel, device, and application, in context with the users' needs and environment.

- + With the Tridion-Fluid Topics connector, Tridion Docs users can unleash the power of Content-as-a-Service in a click: publish Tridion Docs content automatically, as often as you need, and serve all your digital channels through Fluid Topics' secured APIs.
- + Break the silos and add all your content sources and formats to the game: Fluid Topics collects and aligns your different content types, PDF, MS Word, OpenAPI, and more, with the same metadata, to offer a unified search and reading experience.

How Does it Work?

The Tridion-Fluid Topics connector natively retrieves the Tridion managed content, structure, and metadata and leverages it to create an outstanding content experience.

What does Fluid Topics collect?

Tridion users can send all their DITA content to Fluid Topics: DITA maps and topics, images, videos, attachments and metadata.

What about specializations?

Customers' specializations of content simply require a DITA-OT plugin with the right Document Type Definitions.

What about language management in Fluid Topics?

Fluid Topics accepts content in all locales of all languages, with support of left-to-right languages, ideograms, and more. Readers can switch content from one language to another.

Does Fluid Topics maintain links in content once it's processed?

Links to topics in the same document and links across different documents work seamlessly.

What formats are handled?

DITA 1.2 or DITA 1.3 are supported, with any specialization of content when needed.

How is content transformation operated?

Once the DITA content has been uploaded, it is processed by Fluid Topics' DITA processor using the provided DITA-OT. It mixes the XML original content with the HTML output of DITA-OT.

What if you modify the existing Tridion content?

To update content or metadata, Tridion users just need to resend it to Fluid Topics.

Does Fluid Topics recognize variants and versions as defined in Tridion?

Fluid Topics supports multiple versions and translations of the same document. Variants are supported thanks to DITAVAL.

Quickly Create Exceptional Content Experiences

A Smashing Documentation Portal Ready in a Snap

The connected Tridion content is immediately available in an out-of-the-box portal with all the core functionalities one should expect:

- » Rights and profile management to protect and share your content with the right audience,
- » User interface available in 23 languages,
- » Fully customizable layout of the portal pages for corporate branding,
- » Engagement capabilities such as comments, ratings and feedbacks,
- » A reading mode adapted to all types of content (text, images, videos, graphs,...) and natively responsive for all devices and screens

Amazing Search

Thanks to Fluid Topics' unique AI-powered search engine, users get access to personalized, contextual answers to their questions, while searching across Tridion content. The Fluid Topics search engine understands and ranks results by considering the user's profile such as the preferred product, version, category, etc. and learns from the user's behavior for always more relevant search results.
